

Linux Practical

1. Manipulating Files and Directories

We can create, delete, copy or move any file or directory using below command:

a) mkdir: We can create any directory using '**mkdir**' command.

Syntax: `mkdir `folder_name``

b) touch: We can create any file using '**touch**' command.

Syntax: `touch `file_name``

For example:

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ mkdir this
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 4
drwxrwsr-x 2 denis installation 4096 Mar 27 09:57 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ touch file1.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 4
-rw-rw-r-- 1 denis installation 0 Mar 27 10:02 file1.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 09:57 this
```

c) cp: We can copy any file and past it anywhere using '**cp**' command.

Syntax: `cp 'target_file' 'directory_name'`

d) mv: We can cut any file or folder and past it anywhere using '**mv**' command.

Syntax: `mv 'target_file' 'directory_file'`

Note: When you are working with **folder or directory** that time some time it's throw an error that '**Directory is not empty**' so that time you have to add '**r**' option in both '**cp**' and '**mv**' command. It will do whole operation recursively.

For example:

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ cp ./file1.txt ./this/
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -R
.:
file1.txt  this
./this:
file1.txt
```

```

denis@sf-cpu-387:~/Denis Shingala/Linux$ touch file2.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ mv ./file2.txt ./this/
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -R
.:
file1.txt  this

./this:
file1.txt  file2.txt

```

e) rmdir: We can delete directory using '**rmdir**' command.

f) rm: We can delete file or folder using '**rm**' command. when we used this command to remove directory that time we havr to add '**r**' flag for recursively work.

For example:

```

denis@sf-cpu-387:~/Denis Shingala/Linux$ mkdir this-dummy
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls
file-new.txt  this  this-dummy
denis@sf-cpu-387:~/Denis Shingala/Linux$ rmdir ./this-dummy/
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 4
-rw-rw-r-- 1 denis installation  0 Mar 27 10:02 file-new.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 10:06 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ rmdir ./this
rmdir: failed to remove './this': Directory not empty
denis@sf-cpu-387:~/Denis Shingala/Linux$ rm -r ./this
denis@sf-cpu-387:~/Denis Shingala/Linux$ rm file-new.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 0

```

2. List all file permissions with example

If you want to see permission of any file in current directory that time you have to use '**l**' flag in **ls** command.

In below example '**this**' folder's first column is '**drwxrwsr-x**'. It is a permission of that file to user.

Here, First let is show that, is it folder or directory? here, '**d**' stand for directory. after that first 3 letter use for user, after that 3 letter use for group and remaining are use for other user.

```

denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 4
-rw-rw-r-- 1 denis installation  0 Mar 27 11:05 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this

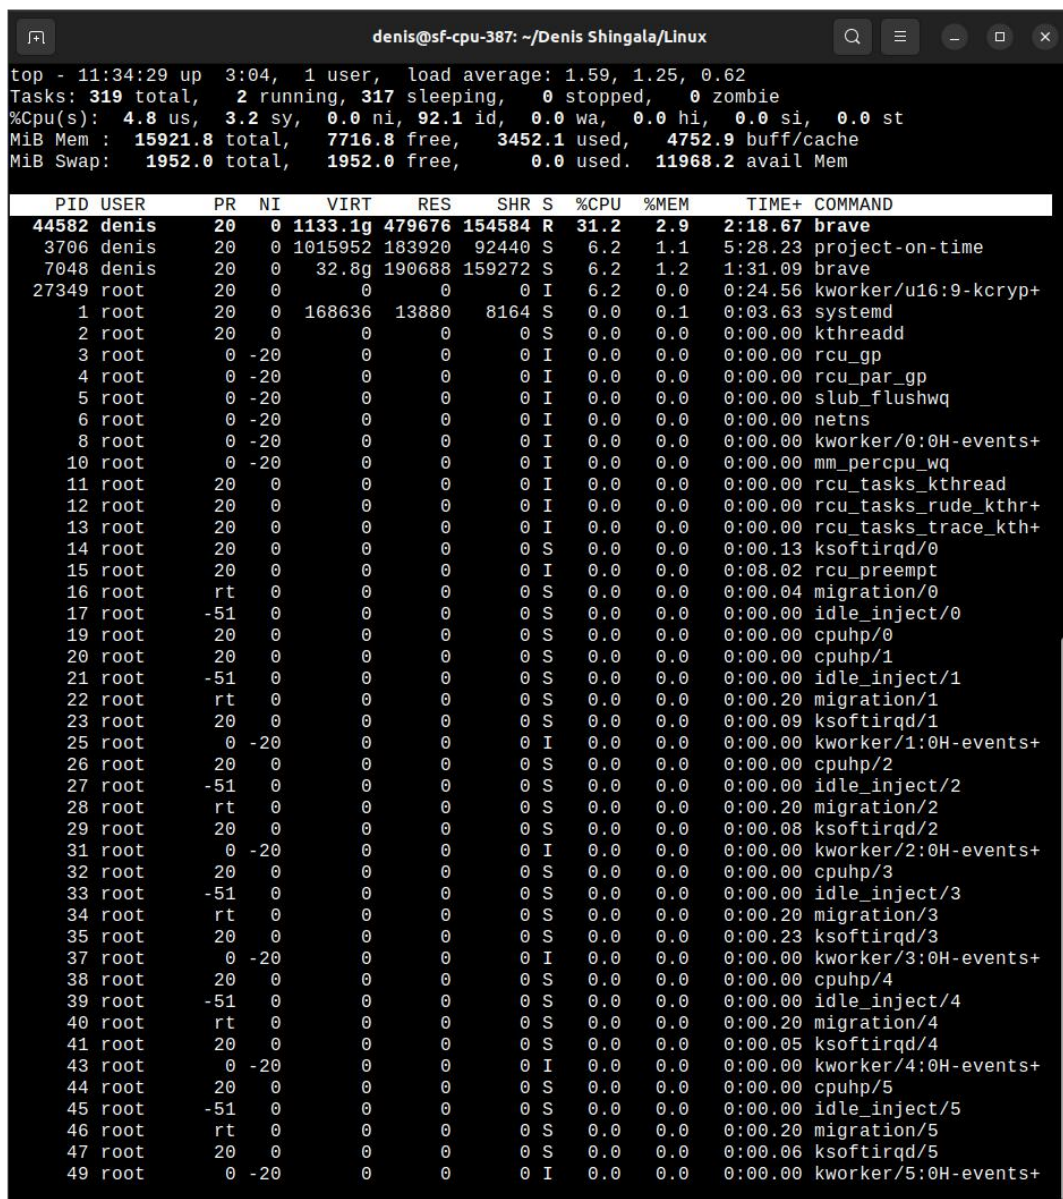

```

3. List all running process

The ps command allows you to display information about running processes.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ ps
  PID TTY          TIME CMD
  6805 pts/0        00:00:00 bash
 44182 pts/0        00:00:00 ps
```

Here, it will show static data but if you want to see dynamic data then use 'top' command for see the all processes of cpu.

```
denis@sf-cpu-387: ~/Denis Shingala/Linux
top - 11:34:29 up 3:04, 1 user, load average: 1.59, 1.25, 0.62

49	root	0	-20	0	0	0	I	0.0	0.0	0:00.00	kworker/5:0H-events+

4. Find particular process by it's name

You can find the particular process by it's name using '**pidof**' command. It will return all pid(Process id) of that process.

Now, if you want to show it inside all process which is running inside CPU so that you can add filter inside '**top**' command using '**grep**' command.

For example,

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ pidof brave
44630 44596 44582 43205 32516 22851 16367 8164 7301 7199 7048 7006 6990 6909 6897 6886 6861
6859 6858 6847
denis@sf-cpu-387:~/Denis Shingala/Linux$ top | grep 6847
 6847 denis      20   0   32.6g 432844 236928 S   0.3   2.7   2:19.71 brave
```

5. How to kill any particular process

We can kill any process via terminal using '**kill**' command.

Here, is example of kill command. so first of all we have to find the pid of particular process then kill it using kill command.

For example,

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ pidof brave
47904 44630 44582 43205 32516 22851 16367 8164 7301 7199 7048 7006 6990 6909 6897 6886 6861
6859 6858 6847
denis@sf-cpu-387:~/Denis Shingala/Linux$ kill 6847
```

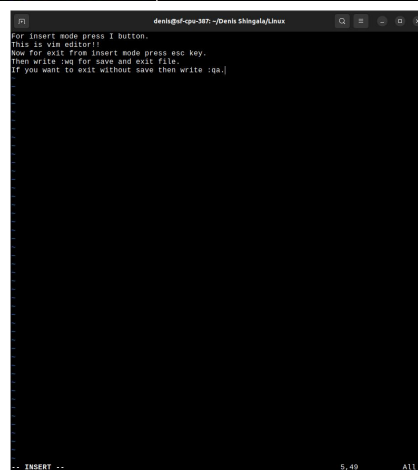

6. Vi or Vim for file editing

If we want to read or update file then Vim is best tool to manipulate file.

We can open file in Vim editor using '**vim**' command.

Here, is a example of vim editor. when you enter inside the vim editor you have to press 'I' for insert mode and write whatever you want.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ vim file.txt
```

7. Change file owner and group

If you want to change the permission of file then use '**chmod**' command. Here, is a one file if we want change it's user permission that user should be only read that file then we have use '**chmod u-wx+r {file/directory name}**'.

Syntax: `chmod {person -/+ permission} {file name}`

here, person might be u(user)/ o(other)/ a(all)/ g(group) and 'r' stand for read, 'w' stand for write, 'x' stand for executable.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ chmod u-x file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-rw-rw-r-- 1 denis installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ chmod u-w file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-r--rw-r-- 1 denis installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
```

If you want to change the file owner and group then use '**chown**' command in linux.

Note: For that we have to give administrator level permission.

For example,

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-r--rw-r-- 1 denis installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ chmod u+w file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-rw-rw-r-- 1 denis installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ chown install file.txt
chown: changing ownership of 'file.txt': Operation not permitted
denis@sf-cpu-387:~/Denis Shingala/Linux$ sudo chown install file.txt
[sudo] password for denis:
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-rw-rw-r-- 1 install installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
```

8. Change group ownership

We can change it using '**chown**' command but we have to write group name after ':' we will see it via example.

Syntax: `chown {user : group} {file name}`

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-rw-rw-r-- 1 denis installation 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
denis@sf-cpu-387:~/Denis Shingala/Linux$ sudo chown :denis file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -l
total 8
-rw-rw-r-- 1 denis denis 186 Mar 27 12:54 file.txt
drwxrwsr-x 2 denis installation 4096 Mar 27 11:05 this
```

9. Moving and Renaming Files

We can cut any file or folder and past it anywhere using '**mv**' command.

Syntax: `mv `target_file` `directory_file``

Note: When you are working with **folder or directory** that time some time it's throw an error that '**Directory is not empty**' so that time you have to add '**r**' option in both '**cp**' and '**mv**' command. It will do whole operation recursively.

For example:

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls
file.txt  this
denis@sf-cpu-387:~/Denis Shingala/Linux$ mv ./file.txt ./this/moved-file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -R
.:
this
./this:
moved-file.txt
```

10. Remove Files and Directories

We can rename any file or directory using '**mv**' command.

Here, is a example of that.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ mv ./file1.txt ./file-new.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -a
*  *  file-new.txt  this
```

11. List the directory contents

If we want to show the all details of current directory's file then we can see it using 'ls' command.

Syntax: `ls {option} {directory name}`

There many flag in ls command below you can see.

Option	Long Option	Description
-a	--all	List all files, even those with names that begin with a period, which are normally not listed (that is, hidden).
-A	--almost-all	Like the -a option above except it does not list . (current directory) and .. (parent directory).
-d	--directory	Ordinarily, if a directory is specified, ls will list the contents of the directory, not the directory itself. Use this option in conjunction with the -l option to see details about the directory rather than its contents.
-F	--classify	This option will append an indicator character to the end of each listed name. For example, a forward slash (/) if the name is a directory.
-h	--human-readable	In long format listings, display file sizes in human readable format rather than in bytes.
-l		Display results in long format.
-r	--reverse	Display the results in reverse order. Normally, ls displays its results in ascending alphabetical order.
-S		Sort results by file size.
-t		Sort by modification time.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ ls -lAsh
total 8.0K
4.0K -rw-rw-r-- 1 denis installation 186 Mar 27 12:54 new-file.txt
4.0K drwxrwsr-x 2 denis installation 4.0K Mar 27 13:53 this
```

12. How I can get the path of working directory

We can see it using 'pwd' command.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ pwd
/home/denis/Denis Shingala/Linux
```

14. How do you do a search and replace in Vim/Vi

If we want to replace some pattern inside the file using vim editor then use below syntax:

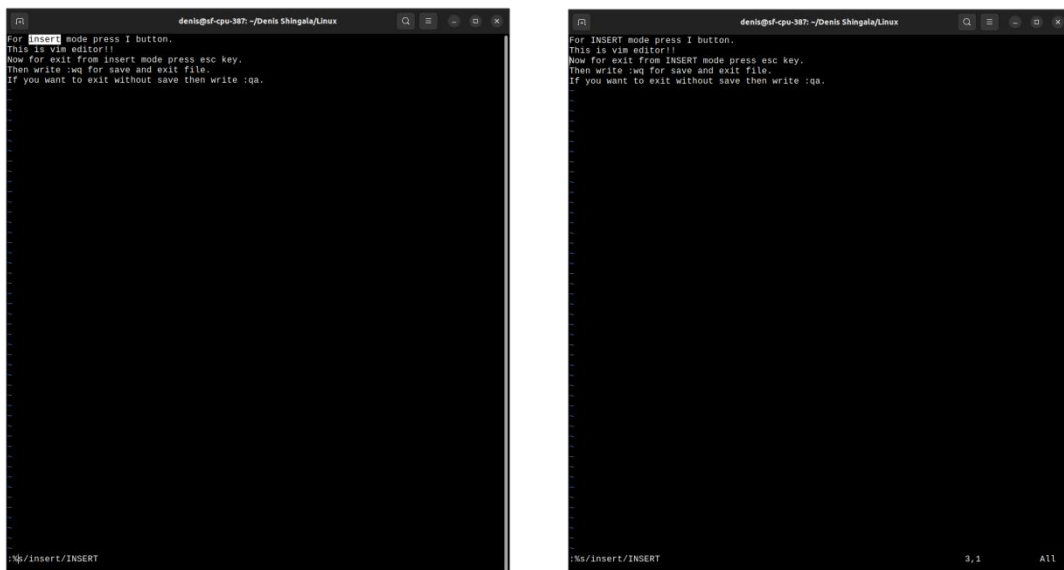

```
:%s/{target-pattern}/{new-pattern}
```

here, % for whole document if you want to replace specific line then bring your cursor at that line and use below syntax:

```
:s/{target-pattern}/{new-pattern}
```

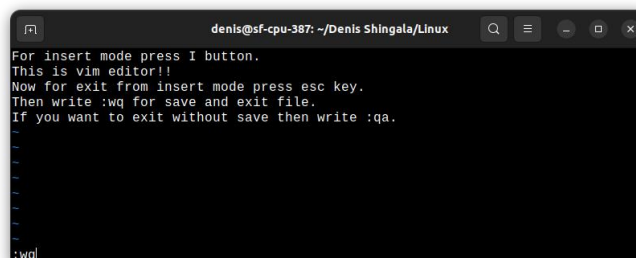

Press Enter!!

For example,

15. How we can save and exit from Vim/Vi file

If we want to exit with save current changes then use '**esc**' key and write '**:wq**' for save and exit from vim editor.

```
denis@sf-cpu-387:~/Denis Shingala/Linux$ vim new-file.txt
denis@sf-cpu-387:~/Denis Shingala/Linux$
```
